

VYOMA Innovation Challenge — Business Plan

MWire Labs — Suno Sutra Prototype: Khasi Education Assistant

Team

- **B (Badal Nyalang)** — CEO, MWire Labs; leads architecture, model development, and product direction
- **Chelang** — deployment, integration, and field operations lead
- **Emmi Grace Wanswett** — logistics and coordination

The MWire Labs team brings direct experience delivering 50+ government and enterprise IT projects in Meghalaya since 2019, giving it a proven channel into government and institutional deployment across the Northeast.

Target Market

- **Primary:** government and NGO-run schools nationwide (std 4-6), starting with Khasi, Hindi, and English — already live in the prototype
- **Architecture is PAN-India by design:** the NCERT-sourced KB content is the same nationally; only the ASR/TTS/embedding models in the pipeline are language-specific and swappable, and open-source ASR/TTS already exist for most Indian languages — so new languages are a model swap, not a redesign
- **Addressable base:** any Indian state's rural/semi-urban government school network; Northeast India (Khasi, Garo, and other low-BHASHINI-coverage languages) is the initial wedge, not the ceiling

Revenue Model

- **B2B2G via NGOs and schools:** MWire Labs sells/licenses the device and content platform to NGOs and school networks, who deploy it to end classrooms — avoiding direct-to-government procurement cycles for the initial go-to-market
- **Subscription:** recurring fee per deployed device (or per school) covering content updates (new curriculum topics, additional languages), model improvements, and support
- Device hardware priced near cost initially to drive adoption; subscription is the primary margin line

Cost Structure

- **Hardware (per unit):** Jetson-based compute, display, audio I/O, and casing — see accompanying Bill of Materials
- **Content/curation:** one-time cost per curriculum topic set (subject-matter + language review), amortized across all deployed units via the subscription
- **Model R&D:** already largely sunk — Khasi ASR/MT/TTS/embedding models are MWire Labs' existing NE-Stack assets, reused rather than built fresh per deployment
- **Support/field ops:** handled through existing NGO/school channel partners rather than a large direct field team

Path to Scale

- **Now:** Khasi Education prototype, already multilingual — Khasi, Hindi, and English live in one pipeline
- **Near-term:** add Garo (TTS already production-ready), expand curriculum coverage beyond std 4-6 science
- **PAN-India scale:** the same KB (NCERT content is uniform nationally) plus swappable open-source ASR/TTS per language lets the same product expand state by state without rebuilding content — Northeast India's 220+ indigenous languages via MWire Labs' NE-Stack, and beyond, plus adjacent verticals (agri advisory, citizen services) already in MWire's product roadmap
